PROJECT RETROSPECTIVE

Attendance Tracker Website | Team Discussion

What went well

• We divided the project work among the three team members.
• We developed a clear understanding of the attendance-tracking workflow.
• We identified the main user actions, such as viewing records and marking attendance.
• We prepared test cases to check the website’s basic functionality.

What could be improved

• We could have planned the tasks and responsibilities more clearly at the beginning.
• We need to test more input cases, including missing details and duplicate entries.
• We could improve the documentation and make the interface easier to use.
• We should communicate progress and problems more regularly as a team.

What we learned

• We learned how to explain the workflow of a web application.
• We understood the importance of functional testing and expected results.
• We learned that teamwork, communication, and proper task division help a project run smoothly.
• We saw why feedback and testing are important before presenting a project.

Action items for next time

Action	Purpose
Assign clear roles to all three members	Avoid confusion and duplicated work
Create a checklist and timeline	Finish each task on time
Test each feature before the demo	Find errors early
Collect feedback and update documentation	Improve usability and presentation quality

Conclusion

Overall, this project helped our team understand the basic workflow of an attendance-tracking website and the value of testing. In our next project, we will plan earlier, communicate regularly, and test features more systematically.

Note: This is a sample retrospective for your team to review and adjust based on what actually happened during the project.
